**Hamel, Minnesota** – Maxxon® Corporation is committed to developing solutions for a world of floor challenges and educating architects and contractors on how these innovations enhance building safety, sustainability, and overall quality. Maxxon's newest continuing education course, *Surface Applied Moisture Vapor Barriers*, provides the opportunity to learn about types of vapor barriers and how they can extend the life of finished floor goods.

The catalyst for creating *Surface Applied Moisture Vapor Barriers* was Maxxon MVP, the latest addition to Maxxon's line of moisture vapor barriers. The course is offered as a one hour, AIA approved continuing education course and participants will receive one LU credit for their involvement.

In addition to *Surface Applied Moisture Vapor Barriers*, Maxxon offers three other AIA approved continuing education courses. They include *Specifying the Right Underlayment for the Right Situation*, *Sound Control in Multi-Story Construction*, and *Achieving LEED® Credits with Green Underlayments & Sound Mats*. Maxxon Corporation presents their continuing education courses at architectural and general contracting firms throughout North America.
